Available Datasets

RCAEval benchmark includes nine datasets organized into three benchmark suites (RE1, RE2, RE3), each covering three microservice systems (Online Boutique, Sock Shop, Train Ticket). Together, these datasets feature 735 failure cases with 11 fault types. Each failure case includes annotated root cause service and root cause indicator (e.g., specific metric or log indicating the root cause).

Dataset	System	Cases	Fault Types	Metrics	Logs	Traces
RE1-OB	Online Boutique	125	cpu, mem, disk, delay, loss	49-59	N/A	N/A
RE1-SS	Sock Shop	125	cpu, mem, disk, delay, loss	57-63	N/A	N/A
RE1-TT	Train Ticket	125	cpu, mem, disk, delay, loss	198-238	N/A	N/A
RE2-OB	Online Boutique	90	cpu, mem, disk, delay, loss, socket	69-77	Yes	Yes
RE2-SS	Sock Shop	90	cpu, mem, disk, delay, loss, socket	74-82	Yes	N/A
RE2-TT	Train Ticket	90	cpu, mem, disk, delay, loss, socket	340-376	Yes	Yes
RE3-OB	Online Boutique	30	f1, f2, f3, f4, f5	68-101	Yes	Yes
RE3-SS	Sock Shop	30	f1, f2, f3, f4	80-107	Yes	N/A
RE3-TT	Train Ticket	30	f1, f2, f3, f4	294-322	Yes	Yes
TORAI-OB	Online Boutique	90	cpu, mem, disk, delay, loss, socket	69-77	Yes	Yes
TORAI-SS	Sock Shop	90	cpu, mem, disk, delay, loss, socket	74-82	Yes	N/A
TORAI-TT	Train Ticket	90	cpu, mem, disk, delay, loss, socket	340-376	Yes	Yes

RE1 Datasets (375 cases): Metric-only data supporting metric-based RCA methods. Five fault types (CPU, MEM, DISK, DELAY, LOSS) across five services per system, with five repetitions per fault-service pair.

RE2 Datasets (270 cases): Multi-source data (metrics, logs, traces) supporting multi-source RCA methods. Six fault types (adds SOCKET) across five services per system, with three repetitions per fault-service pair.

RE3 Datasets (90 cases): Multi-source data focusing on code-level faults (F1-F5). Supports diagnosing code-level faults through telemetry data, e.g., leveraging stack traces in logs or response codes in traces.

HDFS_v1

HDFS (<http://hadoop.apache.org/hdfs>) is the Hadoop Distributed File System designed to run on commodity hardware. Due to the popularity of HDFS, it has been widely studied in the literature.

This log set is generated in a private cloud environment using benchmark workloads, and manually labeled through handcrafted rules to identify the anomalies. The logs are sliced into traces according to block ids. Then each trace associated with a specific block id is assigned a groundtruth label: normal/anomaly.

We have preprocessed the dataset for easy use in research, including:

- HDFS_templates.csv
- anomaly_label.csv
- Event_traces.csv
